The new wave in trading room technology.

Sahgal, Pavan; Schmerken, Ivy
Wall Street Computer Review, v5, n4, p29(12)
Jan, 1988

TEXT:

The New Wave in Trading Room Technology

Competitive pressures, globalization and increasing concern for controlling trading risk and market exposure are shaping the new generation of dealing rooms in the United States and Britain. Even as financial market structure, technological advances, and a host of product offerings and consultancy services help determine what kind of systems will be in use in the trading rooms of tomorrow, the operative phrase in the wake of the stock market panic of October 1987 seems to be risk management.

Consequently, there is increasing focus on how technology can be used to integrate the front-office trading activity with the back-office recordkeeping detail.

Indeed, at a major securities industry automation conference held in London last November, billed as Computers in the City, the novel idea of creating a so-called "middle office" was discussed.

The idea, expounded by Ian Macleod, managing director of Logica Financial Systems, London, is to use leading edge technology and techniques to create a collection of cooperating computer systems between the front office and the back office. These systems would offer senior management of a securities firm the ability to monitor risk, assess profitability, track cash flow and liquidity, address compliance support, and generate various confidential reports of value in the daily running of the firm.

"The central, middle office can be viewed as the ultimate management tool," says Macleod. "It is not only a necessity, it is long overdue."

Nevertheless, many organizational issues must be resolved before such a middle office can provide a flexible base for future trading systems development.

Meanwhile, another major drive in dealing room automation is to develop a way for traders to extrapolate critical information from a plethora of data.

One way may be to harness artificial intelligence in sifting through information contained in dozens of databases and to use digital data feeds that can deliver numbers directly to computer-resident analytical software.

However, at present the quality and flexibility of digitally delivered data is still not up to par, prompting many brokerage firms to incorporate both older video feeds and newer digital feeds into trading systems.

A video feed uses broadcast technology to deliver pre-formatted rigid pages of data to a user's computer screen. Data must be manually keyed into a spreadsheet for further processing.

A digital feed delivers a stream of raw data directly to the computer, allowing relevant information to be selected by the user's analytical programs for instant processing without manual intervention.

At hand are a host of vendors offering solutions and tough competition to Chicago-based Rich Inc., a Reuters subsidiary, and Danbury, Conn.-based Micrognosis Inc., a Control Data subsidiary, which till now have been the two main players in the field of trading room technology as makers of dealing room data switches. (See The Dealing Room Wars: Rich vs. Micrognosis, WSCR April, 1987).

IBM Enters Market

The newer players competing for a slice of the market--estimated to be at least \$1 billion per year in the United States and \$0.5 billion dollars per year in the U.K.--include such mainstream suppliers of

computers as Digital Equipment Corp. (DEC), International Business Machines (IBM), Data General, Sun, Apollo, and Stratus. Other challengers include Data Logic, a Raytheon Co.; CP Technology, Bishopsgate, Programit, Citicorp, Contel IPC, CMQ, V-Band, CCF Group, QV Trading, Network Utilities, Wilco Int'l, and various niche players. Also in the race are data vendors, such as Reuters, Telerate, Telekurs, Lotus, and ADP U.K., who are targeting the trading room market with offers of specialized data feeds or analytical software.

Dealing room systems is a particularly lively field in London. Not only does the market trade a range of instruments, but it has long been accustomed to multicurrency trading.

Among U.K. vendors, Datacorp Ltd. offers LIMA, an integrated dealing room software system for video and digital feeds developed by Line Data, its distributor in France. When American Express Bank decided in early 1987 that it wanted a separate dealing room from Shearson Lehman Brothers in London, it tapped Datacorp to provide a fiber optic system and consultancy services. The bank chose Datacorp's Citidealer, a dealing room system, and CONNECT, a conversational telex system also marketed by Datacorp.

In other developments, Logica Financial Systems, with offices in London and New York, developed FASTRADE in conjunction with Phillips & Drew, a leading U.K. Securities firm. The system already supports trading in U.K. and international equities, futures, options, and currencies and runs on Stratus and IBM Sysem/88 fault-tolerant hardware. Scrimgeour Vickers, a London brokerage owned by Citicorp, provides a system called Dog Fox (named after the firm's escutcheon) for trading on the U.K. equity and Gilt markets. TCAM Systems and Herzog Heine and Geduld, vendors of the TR-AID and COLT trading systems for the U.S. over-the-counter markets, have both adapted their products for the U.K. market. And NMW Computers, a service bureau in Britain, is targeting brokerage firms with back-office and market making systems for equities and Gilts as it is competitor, the CCF Group.

Even Los Angeles-based Quotron Systems, another Citicorp subsidiary, is mounting a serious effort to leap beyond retail brokerage houses into trading rooms. The Quotron Trading System is based on an open architecture that supports both video and digital data feeds, including Rich and Micrognosis. Quotron is positioning the Quotron 1000 minicomputer as a digital switch product, according to George Grant, director of product marketing and planning. Beta sites were being installed on Wall Street during the fourth quarter of 1987; Quotron anticipates installing the first live production sites by March, 1988. This includes a digital feed of Quotron's entire database of equities, options and commodities, broadcast at 56 Kbps.

At stake is a slice of a global trading systems market whose value exceeds \$2 billion annually in the United States, U.K., and Europe, and which vendors estimate is likely to grow at a yearly rate of 30 percent over the next five years. These numbers do not include the emerging markets in Japan and the Far East, nor the price of data or other peripheral software and services.

"The market is still in its infancy," says Matthew Cea, vice president of marketing at CP Technology Inc., a trading systems vendor with offices in London and New York. "It's a multi-billion-dollar market if you take into account the applications that integrate with the trading environment. We haven't even scratched the surface of it."

The increased competition is putting pressure on vendors to come up with value-added features and innovations, such as integration with the back-office, integration of voice and data feeds, increasingly more sophisticated use of graphics in helping the viewer understand data at a glance, and the consolidation of a host of critical data feeds to allow distributed intelligence and complex analytics. Some are even talking about trading systems which in the 1990s may run off supercomputers because of the unique number-crunching abilities of these machines. According to sources, IBM is already looking into the area as a future opportunity for the firm.

"The future is about intelligent systems, integrated systems, and systems that add value to data," says Jerry Gross, technical and marketing

director at Data Logic.

Even so, among the market trends affecting the development of trading systems are 24-hour trading, working at home, fear of fraud, globalization, and increased competition. But a key technological issue thwarting the field is the lack of data interchange standards as well as the absence of universal standards for trading systems development.

"New technology infrastructures are emerging and what's needed is a standard for data interchange," says Allan Grody, president of Financial Intergroup, a New York consultancy. "The evolution of technology is predictable, but the capital requirements [in trading room automation] are huge."

It is likely, however, that securities firms will raise the capital because their survival may depend on it. One major reason is that information--which today is increasingly stored and studied electronically--is emerging as a key corporate resource. Investment in technology enhances the efficient use of data.

"The dealing room market is still immature and few standards exist," notes Dilip Chandra, IBM's market development manager in London. "Our competitive edge comes from the fact that we'll probably be the only vendor of mainframes, minicomputers, and PCs likely to be around for some time to come. What's in it for the customer is computability in perpetuity."

IBM's trading room target is currently the United Kingdom. The computer vendor may also try to penetrate the Japanese and Far East markets, wooing such firms as Nomura, Daiwa Securities, and Yasuda Trust with whom it already has business relationships or negotiations in progress.

IBM Trading Systems recently set up an alliance with the International Stock Exchange, London, to offer the RADIX trading system. RADIX is a software package that uses the IBM Personal System/2 as the workstation processor and can operate on IBM's Token Ring local area network. A typical RADIX system accommodates up to 200 workstations, with a single data feed serving up to 30 workstations. But in its current version, the IBM RADIX system appears to have a limitation in that the systems manager must build composite pages for the user.

The French Connection

Even as the United States and the U.K. appear to be the focus of trading systems innovation, recent conversations with software firms and consultancies in London indicate there is a determined bid by French financial institutions to use trading room technology for a higher market profile in the 1990s.

"Some of the best technology that's being implemented is in France," reveals Ross Taylor, manager of global product marketing at CP Technology in London. "There are some very creative, proprietary solutions that are going into Paris because of their proximity to and competitiveness with London."

"The commitment the French have to adding value to the public domain information they are receiving is steering them more and more toward digital solutions," he adds.

The French have also been buying brokerage firms and international trading firms and examining ways so that each part of the business may use the same-source information differently, over and over.

Although the British have various digital data feeds, they do not make the most of it because users are less sophisticated or aggressive about investment analytics than their peers across the Atlantic, add industry sources in the U.K.

On the other hand, digital distribution use is virtually nil in the United States, though analytics software is advanced. In the U.K. the reverse holds true.

Bank of Boston might as well be home of the brave. Karl Sittler, computer consultant, is contemplating an all digital system for the bank's treasury department which does arbitrage and foreign exchange trading. Bank of Boston chose BishopsGate Ltd., a subsidiary of Alphanumeric PLC, for 20 of those 100 positions.

Sittler prefers to choose Sun Microsystems workstations for the remaining 80 positions. He doubts if BishopsGate can meet the information

management requirements of the next two to three years, when traders will need much more graphics processing and number crunching. "The horsepower just isn't there," says Sittler referring to the fact that BishopsGate's technology utilizes personal computers to take in digital feeds. "Why choose a third generational solution when a fourth generation is already available?" he asks.

He plans to put a Sun 360 workstation in front of each trade for \$9,900, which includes four megabytes of memory. To take advantage of Sun's windowing, Sittler is examining AI products. One is Contessa by Prophecy Development, Boston, which integrates several applications on one workstation. A trader can flag conditions and thresholds, to set multiple feed and multiple market trading positions.

Following Big Bang, the U.K. markets are being forced out of a gracious Age of Quill Pens to a demanding electronic era. "[In Britain] they've come from an environment of cozy clubs, where there was no competition," offers one U.K. source. "They are now scrambling."

The "scrambling" has already attracted new attention from North American vendors such as IBM and Data General, who hope to exploit an untamed opportunity. Even DEC is said to be setting up a U.K. Financial Systems Services group. Data General has provided dealers at the London-based Sheppards brokerage firm with personalized databases with a new module on its Hydra financial information management system.

"We developed the Sheppards system in response to dealers' demands for an up-to-date individual database relating to the stocks and shares with which they are personally involved," says Janet Wood, Data General's financial marketing manager in London.

Indeed, truly revolutionary advances in trading room technology may call for not only a strategic alliance between vendors of hardware, financial software, and data, but key input of proprietary trading methodologies by the end user: the trader himself.

For the present, the future direction of dealing room technology is focused on the consolidation of market data services offered by different vendors. The idea is to allow a trader to access data from diverse sources on multiple windows or quadrants of the same screen.

"The trader will become smarter and smarter in using composite pages and putting them upon the workstation," says Martin Templeman, senior vice president of SPC Software Services Inc., New York. SPC is the developer of Pricewatch, a software product which captures digital data feeds from multiple sources, and converts them into a common format which can be accepted into a workstation.

Age of Analytics Is Here

"The people using trading systems are getting more and more analytics-minded," says Joseph Cunningham, managing director of CP Technology at the firm's London offices. "They want to see a lot more data than before, have it on-line, and be able to manipulate it in real-time instead of manipulating it statistically."

Even so, real-time manipulation involves a lag of two or three seconds, the time it takes to access a database and process the information in analytical software.

For its part, CP Technology markets two products: MFX-1, a baseline system that offers video switching, limited digital switching, and connections to in-house information sources.

A second offering, MIX, is an Ethernet-based system that uses DEC MicroVAX hardware. It has a complete digital network behind it and also supports video switching. The MIX system also offers gateways to other computers and databases and includes a "tool box" feature that runs a set of analytical programs on an IBM PC or IBM PS/2, which acts as a workstation. However, Sun or Apple machines can be used as trader workstations because both DOS and Unix are supported by MIX.

Given the thrust toward analytics, Telekurs (U.K.) Ltd., a vendor of financial data, has entered into a strategic alliance with Apple computer to introduce a real-time investment decision support system called INDES. The system, aimed at dealers and fund managers, consists of a 32-bit Apple Macintosh II linked to a consolidated digital Telekurs price feed. The price feed covers major financial markets and all types of instruments.

"The product was first launched in Switzerland," says Kurt Moser, managing director in London. It was premiered in London in November, 1987 at the Computers in the City trade show. According to J. William Howard, Jr., president of Telekurs (North America) Inc., INDES will make its U.S. debut "sometime around March, 1988."

INDES can maintain up to 100 mixed international portfolios, complete with currency conversions, commissions, profit and loss, cash balance, and other calculations in real-time. It allows the testing of trading strategies and measures their impact on the portfolio's cash position. Formulae used in the system, which allows limit minding for up to 100 items, may be user defined. Price movements, along with trends and averages, are displayed graphically. The user may also construct price tickers to run across the display continuously.

New Players Offer Challenge

The new offerings are examples of the challenges faced by Rich Inc. and Micrognosis Inc. Each company previously specialized in video switch technology which routes pages of market data from suppliers such as Telerate and Reuters onto multiple screens, controlled by a central keyboard. The entry barriers to video technology were very high.

"Now that digital systems technology is here the entry barriers are lower," observes Michael Schiffman, vice president of domestic sales at Rich Inc. in Chicago.

Today both Rich and Micrognosis, locked in a fierce battle for U.S. market share, provide a hybrid video and digital switch information distribution system. Micrognosis pioneered a purely digital system five years ago and is now producing a third generation of its TRADE System.

Internationally, Micrognosis reports seeing Data Logic, the U.K.-based Raytheon subsidiary, as a major challenge. But Micrognosis claims Data Logic needs worldwide credibility to crack the U.S. market.

Data Logic offers a family of three trader workstations. "Not every user needs the large bell and whistle," explains Steve Brandon, senior consultant at the firm's offices in Harrow, England. "A couple of years ago, firms were into the mechanics of delivering information to traders' desks. Now the emphasis is on how traders can use the information to their advantage."

"There is a need for a range of workstations offering a cost-effective solution for varying needs. The future lies in added-value processing," he says.

Open Systems Are Vaunted

Data Logic sells a Unix-based product. Its central digital-switching system can run on DEC, Unisys, IBM, or Stratus hardware. "The thing [that] we feel separates us from the others is the open systems approach," says Flick Willetts, financial systems marketing communications manager at the firm. "We don't have a background that ties us to any one variety of hardware."

At Computers in the City, Data Logic premiered a personal workstation for traders who need access to digital market information. The Data Logic Personal workstation, as the machine is called, offers full trading position capability and direct user control over sophisticated calculations and analysis.

The firm also displayed a series of trading workstations, ranging from a dumb terminal to the Hybrid workstation, which offers continuous access to both digital and video-switched market data.

Although some experts predict all data feeds will be in digital format by 1992, people in the field, such as Willetts, say it may be "well into the late 1990s" before that holds true. "People forget the number of PC-based feeds that are installed," she points out. "Because of systems overloads, it may be necessary to retain these as video feeds. Therefore, no major player can live without both digital and video feeds at present."

Even if total conversion from video to digital is five years away, a number of niche players have already sprung up to take advantage of the lead time and offer the new technology now. Rich and Micrognosis are facing competition right and left.

Turret makers such as V-Band Systems of Yonkers, N.Y., Contel IPC of Greenwich, Conn., Positron in Montreal, and British Telecom in New York,

are building trading information distribution systems which marry voice, video and digital data feeds. British Telecom and Positron talk about allowing traders to connect to client databases, capture trades and route electronic tickets to the back-office--all through software-programmable trading turrets.

Competition is also coming from software developers who are creating market data interfaces to capture digital data feeds on minicomputers and workstations. The players here include New York-based Programit, Digital Equipment Corp., QV Trading Systems, London's Aregon International, and Teknekron Software Systems of Berkeley, Calif.

Among these, London-based Aregon has come up with FIST, an architecture for building complex, real-time, distributed financial trading systems. FIST is named after the Financial Information Systems Team that designed it. It runs under the DEC VMS operating system, across a range of DEC VAX hardware, from mainframe to workstation. Aregon develops and sells technology rather than packaged solutions in the belief that financial firms would prefer using their own staff to implement the technology to suit their unique needs.

New-York based QV Trading Systems provides the QV Market Data Interface (MDI), which operates as a real-time ticker plant running on Sun or Apollo workstations at three major New York brokerage houses.

These firms are using the MDI on a network server to feed custom applications, says Charlie Weeden, QV Trading president. A quantitative group in a research department managing a portfolio has wired MDI to monitor changes in stock prices. An alarm rings when certain price parameters are met, alerting traders to make changes in the portfolio.

Workstations Are Assessed

Other financial institutions building trading rooms are assessing integrated workstations' ability to process digital data feeds.

A workstation is a single-user computer that's connected to a local area network in order to optimize its power fully, explains Don Bracken, industry marketing manager, capital markets, for Digital Equipment Corp. in Burlington, Mass.

"The bottom line is that the workstation and the network server are an electronic link between the front office and the back office--a critical piece of infrastructure," adds Bracken.

On Wall Street, however, Digital's biggest challenge comes from Sun Microsystems of Mountain View, Calif. Sun is currently the most popular workstation for traders because of its multiple windowing and graphics capabilities. Sun utilizes a standard operating system, and standard network architecture, so firms can connect other vendors' machines to the network.

Sun is very "Macintosh like," because traders can use a mouse to enter trade tickets, clicking on variables, says Peter Vinella, partner in Berkeley Investment Technologies, a Berkeley, Calif.-based consultancy specializing in market data feeds. Using Sun workstations, arbitrage traders can quickly look at a menu of factors, such as p/e ratios, beta, and market capitalization.

"Sun has become a status symbol, the Porsche of business computers," comments Seth Merrin, president of Merrin Financial Systems Inc., a trading software firm in New York. "Digital is the old machine; Sun represents the new."

Sun delivers "a tremendous bang for the buck," adds Vinella, a quantitative consultant with advanced degrees in mathematics and physics. From an analytics standpoint, "we can price algorithms [predetermined sets of instructions] with six million calculations per night," he says. In Vinella's view, with Sun he can put a \$30,000 piece of hardware on a trader's desk relative to the \$800,000 cost two or three years ago using Digital machines. Today, it costs \$2 million to \$5 million to create an entire ticker plant on a Sun workstation for about 100 to 150 traders, including inventory control and risk management, and preliminary analytics.

"Large firms have built internal ticker plants to replace Rich, Micrognosis and Quotron," says Vinella. "You can get ticker feeds from Standard & Poor's, plug them into software by FD Consulting of Stten Island, N.Y., which 'parses' the data, stores it in a database, and

distributes it to traders."

Parsing is the process of separating a programming statement into basic units that can be translated into machine instructions.

Some traders use the standard Rich, Micrognosis, or Quotron screens to display market data, but operate the Sun-based ticker plants as filters for index arbitrage systems. That way the ticker plants only process a subset of the 16,000 equity quotes generated by U.S. stock exchanges every day.

Rich, Micrognosis Hold Ground

Rich and Micrognosis had the foresight to recognize the workstation trend and both firms are aggressively integrating intelligent machines into their hybrid video and digital architectures. Rich Inc. became an original equipment marketer or OEM for Sun Microsystems workstations, but also plans to support Digital VAX stations, Apollo, and IBM OS/2 machines.

"I think the undoubted direction of digital systems is towards intelligent workstations," says Stephen Sutton, vice president of development, at Micrognosis, who cites workstations by Digital, Sun, Apollo and potentially IBM PS/2. "They not only allow for the distribution of information but also allow you to run applications which potentially process that information," says Sutton.

In the past 12 months, Micrognosis has done a lot of work on interfacing its TRADE System with workstations. Micrognosis, however, has not tied itself to any particular workstation vendor. By late November it had taken orders for systems based on Sun and Digital hardware, and had discussions regarding Apollo and IBM PS/2 implementations with other customers, reveals Sutton. Micrognosis plans to provide tool kits which let people develop their own applications which makes use of the information that's available on the TRADE System. However, Sutton stresses that Micrognosis software is installed on the Sun workstation: "It is our software on our backbone," he points out.

Though Rich and Micrognosis are not the only game in town, they are still the main players at large trading houses. This status alone ensures that video market information will co-exist with digital-based feeds for some years to come.

Business is booming at both firms. Rich doubled the number of trading positions from 1985 to 1986 and expected to double them again by year-end 1987. Rich had approximately 19,000 keyboards installed as of Oct. 31, 1986 vs. 10,315 on Dec. 30, 1986. It had 40,000 screens installed in U.S. and overseas trading rooms as of Oct. 30, 1987, vs. 23,024 screens at year-end 1986. Between Sept. 29, 1987, and Nov. 10, 1987 Rich added 18 new clients; by Nov. 20, 1987, it had to reprint brochures as a result of winning four more clients, split between the U.S., London, and Switzerland.

Rich's clients include Bear Stearns, Daiwa, Dean Witter, Drexel Burnham, E.F. Hutton, Hambrecht & Quist, John Nuveen, J.P. Morgan, Kidder Peabody, Salomon Brothers, PaineWebber, Bankers Trust, and Merrill Lynch in five locations -- London, New York, Singapore, Tokyo, and Zurich.

Rich expects total revenues of \$123 million for all of 1987, including \$13 million for service contracts, a 23 percent increase above 1986 sales of \$100 million.

Rich vs. Micrognosis

Micrognosis competes fiercely with Rich. At year-end 1987, the firm had approximately 22,160 screens installed in the United States and 22,884 screens abroad. The firm projects revenues of \$67 million for 1987. The company has been growing at an annual rate of 35 percent to 45 percent since 1982.

Meanwhile, Micrognosis, too, appears to be adding clients by leaps and bounds. In October, 1987 it added Prudential Insurance, Capital Markets Group, Newark, N.J. and E.I. DuPont de Nemours & Co. Inc., Wilmington, Delaware. Other clients added in 1987 include ABN International Capital Markets Corp., N.Y.; Shearson-Lehman Bros., Chicago; L.F. Rothschild, Unterberg Towbin Inc., New York; and Industrial Bank of Japan, N.Y.

On the international front, Micrognosis added Swiss Bank Corp., in Basle and Geneva; Long Term Credit Bank of Japan, in London; Okasan Securities Co., Ltd., in Tokyo; Lloyds Merchant Bank, London; Industrial Bank of Japan in Tokyo; and Commerzbank, A.G. in three cities, West Berlin,

Frankfurt, and Paris.

American brokerage firms are installing workstations and networks not only to offer decision-support tools to the trader, but also to capture data on the trade directly as it is made. The electronic ticket that's created at the workstation could one day drive all the rest of the business for these firms.

"The workstation approach is only going to grow as more feeds become available," says Jacques Perold, director of investment systems for Fidelity Management & Research Co., Boston. Fidelity chose the Teknekron trading system from Teknekron Software Systems, Berkeley Calif. "We found out traders have taken on digital feeds like a house on fire," says Perold.

Fidelity implemented 55 trading workstations for two new fixed-income and money market trading areas, integrating digital data feeds from Telerate, Reuters, and Knight-Ridder's Tradecenter. The firm installed a live trading system for 35 fixed-income traders on Nov. 9, 1987, after two months of pilot testing. In December 1987, Perold planned to install 20 additional positions for money market traders, moving to a new trading floor. Teknekron wrote software to read each vendor's digital feed. Each trader has a Sun/3 workstation with 19-inch color monitors which link to real-time market data feeds and a transaction-processing system on an IBM System/38 mainframe.

"We liked Teknekron's approach to trader workstations," explains Perold, citing the ability to create composite pages from multiple digital data feeds. "Teknekron sees itself not as a software developer but as a systems integrator."

New Links to Back Office

Among other noteworthy products now available, the Merrin Financial Trading System is an example of a program that automates clerical tasks. It captures the trade once at the traders' IBM AT and disseminates it to a back-office system or external service bureau. "With an intelligent system you can prevent errors at input," says Merrin, a former arbitrage trader.

The Merrin system shows traders such things as on-line cash, on-line positions, average price paid for shares, and working quantity--or leaves--left to execute. It also prints a hard copy of the trade ticket as required by SEC mandate.

Brokerage firms with locations in foreign countries will need to monitor their foreign currency exposures locally. Already, one vendor, Opti-Management Resources Inc., Princeton, N.J. is offering a portfolio management system called The Trading Assistant to help firms measure their global exposure across multiple currency instruments--including equities, options, futures, foreign exchange, bonds, and precious metals. "It allows you to look at an account holding in-between the front-office and the back-office," explains Jim Mersfelder, president. Investment houses which trade on behalf of multinational corporations will need such packages to service their clients, adds Mersfelder. "If you can't measure it, then you can't manage it," he says.

Decision Support for Wall Street

The major challenge facing wall street firms is the ability to integrate back-office transaction processing systems with the front-office market data and analysis systems. As a result of the October 1987 stock market plunge, wall Street firms are most interested in traders calling up their positions throughout the trading day, checking profit and loss.

FTS Inc., a New York consultancy, develops decision support systems to fill the gap between the research department, the trading desks, and the MIS department. "There's a big gap at most firms in delivering information systems for the traders that are actually useful," says David Moskowitz, senior vice president of FTS, who conceived the idea for its Decision Support Analysis System (DSAS) aimed at fixed-income traders nearly three years ago.

The system, which currently runs on an IBM PC AT, was recently converted to run on a Sun workstation to take advantage of its enhanced graphics capabilities.

"The whole concept of DSAS is to bring a sophisticated system that has some analytics that are trading related, put right in front of the trader, and also allow him to enter his positions into the system to do his

trades," explains Moskowitz.

"Because of the larger screen size and multi-tasking on the Sun, we're able to display far more information for the trader at one time," he adds.

Because of Sun's graphics powers, a trader can re-price an entire 10-year sector of the government bond market in half a second--with one or two commands, claims Moskowitz. At any instant, the trader can display in real-time his exposure to the 30-year bond maturity curve. Not only can he see whether he is long or short, but he can also see which maturities he is long or short in, ranging from next day to 30 years out.

Feedback to the Trader

A trader receives feedback on risk, profitability and exposure to the market on a minute-to-minute basis as he is trading. Research concepts pertaining to bonds, such as duration, and option pricing through the Black-Scholes model are provided in real-time.

By early 1988 the system will expand coverage to all fixed-income instruments, including Treasury bills, bonds, notes, zero coupons, corporates, mortgage-backed securities, debt options and futures. Today, all existing FTS clients trade U.S. government bonds on the system. The users include New York's Drexel Burnham Lambert and Thomson McKinnon Securities; Toronto's Wood Gundy; and Japan's Big Four, Daiwa Securities, Nomura, Nikko and Yamaichi, two of which installed DSAS at sites in London and Tokyo.

While the system provides a full-range of analytics for trading, hedging, and arbitrage, where DSAS is unique from other strictly bond analysis packages such as Bloomberg's Market Master or Telerate's Tactician is that it concentrates on "position management for the trader," claims Moskowitz.

"That is really a black hole in a lot of institutions," he observes. Though brokerage firms have "back-office systems, which do the clearance and regulatory reporting, and they've got some super, fine rocket-scientist-type models," says Moskowitz, there's a void in the middle with the absence of sophisticated support to the foot soldier, the trader, he adds.

The creation of a middle office, symbolized by back-office functions creeping into the front-lines, is part of the new wave in trading technology. But the reverse is also true, as evidenced by FTS managing director Arthur J. Plourde, who is pioneering the movement of high-powered workstations into the back office. Plourde is responsible for the development of a product called Financial Trading System (FTS), a real-time, on-line trade-processing system which provides positions, profit and loss, mark-to-market, and risk and exposure capabilities. This information is made available to senior executives in trading rooms, as well as department managers, says Plourde.

"A \$50 million trade which fails over the weekend could cost a firm \$30,000," he illustrates. Plourde says that the strongest part of the system is that it gives firms' management a new degree of control.

The FTS system operates on an IBM mainframe, but is accessed on an IBM terminal that plugs into a Rich or Micrognosis trading system. Trading data can also be made available to back-office operators. FTS also plans on introducing a workstation for securities firms that are in the mortgage-allocation business. Plourde is considering Digital's color VAXstation 2000 connected via an Ethernet DECnet network to IBM MS-DOS machines. Creating original forward trades into mortgage pools is a complex, and labor-intensive process, where workstations provide a new, flexible way of looking at data in the system.

Integrating Multiple Feeds

Even as risk management features are assuming greater importance in trading systems, dealing room designers are also grappling with another problem: How to integrate trading in multiple instruments--with their multiple data feeds--on a single workstation.

One U.K.-based firm, Intra-City Systems, London, offers a real-time processing system called the MAX Ticker Plant which consolidates data from varying sources into a common format for transmission to network systems, databases, or stand-alone applications.

"If you trade in a full-range of instruments, you need a range of data feeds to support the trading," explains Martin Tate, managing director at Intra-City. "MAX, which stands for Markets Access, centralizes the capture of real-time information. It sits in front of any system that needs that information, allowing not only the integration of data feeds, but also the ability to offer risk management and complete position details on one system."

The MAX Ticker Plant runs on Stratus machines, thereby also bringing fault-tolerance into the trading system. The important value in a system such as MAX is that securities firms may sign single contracts with individual vendors to receive their various feeds and redistribute them to various parts of the firm as a consolidated digital feed, without having to enter into new contracts for each department, thus saving on connection charges.

Digital Kinks

However, there are many kinks and pricing issues to be ironed out before digital data feeds will be cost-effective, say practitioners in the United States. E.F. Hutton, before Shearson Lehman Brothers announced plans to acquire the firm, was among Wall Street houses watching costs closely. Hutton distributes Telerate's SOP feed, in which traders specify the pages they want, through the Rich Triarch system to 300 traders. Telerate transmits up to 32 pages of data per line.

"Pricing issues work better on the video side," says Natesh Mohan, senior vice president, telecommunications, at Hutton. "Until companies such as Telerate are more user-fair about pricing issues, we find it extremely painful to distribute Telerate's digital feed (and) to pay for access to optional services such as Money Market Services (MMS) and McCarthy, Crisanti & Maffei."

One problem with digital feeds at present is that brokerage houses cannot restrict access to optional information services. But Hutton is able to restrict access to these same services when it distributes Telerate's feed through the Rich video switch.

"By year-end 1987 we will have reconfigured our system for usage-fee reasons," discloses Mohan. He plans to remove all optional services from Telerate's digital SOP feed and put optional pages on the video version of Telerate. No point paying hundreds of thousands of dollars for 300 traders to access a technical market information service, says Mohan, when maybe only 10 traders are really interested in reading it.

Reuters' Role

Reuters' Integrated Digital Network (IDN) feed will have an impact on digital feeds, says Fidelity's Perold. It's a true digital feed unlike Telerate's SOP and Reuters real-time data feed RTFD which are page-oriented feeds. However, Reuters' IDN feed continuously shoves data down a thick pipe at the rate of 56 kilobytes per second. "You don't have to request the data because it constantly blasts updates as they occur," adds Perold.

Reuters' IDN feed taps 130 exchanges with real-time prices all over the world, covering 150,000 international stocks, bonds, futures and options.

Though video feeds are extremely fast, their chief drawback is that video market data cannot be analyzed on a personal computer. Traders must manually re-key the market data into their analytical software.

Both Rich and Micronosis provide integrated trade workstations that integrate video and digital information distribution. Rich's Triarch system--an acronym for Trading Information Architecture is an open architecture which consolidates external market data services, internal host-computers and third-party software applications. The trader controls the various information services by a central keyboard, which switches different pages onto multiple screens.

But now Rich is imbedding certain intelligent software calculations into Triarch. Rich is using the Triarch Real-Time Spreadsheet (RTS) as a financial modeling and decision-making tool using real-time data to test what-if trading scenarios. It allows the user to select a piece of market information and then to use that item as a value in a spreadsheet cell, says Rich's Schiffman. Any time market data updates, the related cells in the spreadsheet will be recalculated automatically, says Schiffman. Rich

has also built in calculations associated with bonds and money market instruments into the real-time spreadsheet cells. This means a trader with Triarch no longer has to use a separate bond calculator, nor rekey those results.

Micrognosis is also moving away from a turnkey black box solution to a much more open solution, which allows traders to develop their own applications along side the TRADE System. Micrognosis claims its technology is superior to Rich because it has already produced the third generation of TRADE System--its-digital feed-based market information distribution system--introduced five years ago.

Markets are changing so fast that trading systems have to be software-based because of volatility in the markets," says Quotron's Grant. Quotron is providing cut-and-paste facilities for composite paging, real-time charting, and technical analysis, as well as real-time spreadsheets. On the decision support side the quote vendor is providing calculators for baskets of securities and indexes. Then it offers a library of software development tools and statistical and financial functions, such as Cox-Rubinstein and Black-Scholes options pricing models. These off-the-shelf tool kits are intended for developers and programmers in data processing shops at brokerage firms.

New York-based Programit, too, is creating software which handles digital data feeds from vendors such as Quotron, Reuters, NASDAQ, Instinet, AutEX, Telerate and Bridge Data feeds directly to a workstation or through a gateway for distribution over a local area network. To capitalize on the workstation rush, Programit signed a marketing agreement with Apollo Computer of Chelmsford, Mass. for which Programit serves as an original equipment marketer or so-called OEM. Apollo is eager to blunt Sun's edge in Wall Street trading rooms.

Apollo "gives us the power of a high-end workstation with Unix capabilities, color and multiple windowing," says Elizabeth Maier, Programit's marketing coordinator. Programit's products run on IBM Ats or Compaq 386's IBM plasma screens, favored by traders because they are oversized. The Compaq 386, based on the 80386 Intel chip, is a contender for the trading room because it can provide the same multiple windowing functionality as the Unix-based Sun and Apollo workstations. "Each partition is equivalent to what you'd see on a Rich or Micrognosis screen," says Maier, indicating Programit aims to compete on every front.

Turret Makers Arrive

At another front, trading turret makers such as Contel IPC of Greenwich, Conn., and V-Band Systems, of Yonkers, N.Y., are moving into the market data delivery services and building integrated workstations which marry voice, video and digital market data information.

Clients want more computer power at the head-end--where the information source enters the trading room--as well as the ability to redistribute the market data to back office or research, says Robert Farrington, Jr., president, market development division, of Contel Financial Systems. Contel IPC will distribute information for use in applications such as dealer analytics and positions keeping. "We believe the opportunity exists to take reams of numbers and bring them down into intuitive signals," says Farrington.

V-Band Systems, another leading maker of dealer boards or turrets--basically high density key telephone systems--is also developing an integrated workstation combining voice communications, video switching and digital data information systems. "Our strategic goal is to offer an integrated dealing system 15 to 20 percent less than if components were purchased separately," says Tom Feil, V-Band's chairman and chief executive officer. In August 1987, V-Band acquired Angus System Inc. of Newport Beach, Calif., for \$2.5 million. Angus manufactures a local area network (LAN)-based video switching device, whose modular design is praised for reducing backroom equipment size.

One uncertainty facing vendors of trading systems is the impact of the stock market debacle of October 1987 on Wall Street. A hiring freeze is in effect at most major houses, says Joseph Tranzillo, president of New York's MVP Systems, a recruitment firm specializing in data processing. "But there are always cracks in a freeze," he notes.

Wall Street's Prerogative

IT is unclear what impact the stock market will have on the roll-out phase of this high technology. "Brokerage firms are not worried about spending \$50,000 on an individual workstation and analytic software," says Gerald Mintz, director of marketing for CMQ Communications Inc., a Telerate subsidiary. But he questions whether firms will spread that development initiative across 100 traders. "Firms will continue their investigations and development of new tools," says Mintz. But he thinks firms will look carefully at the roll-out phase as long as they are faced with market uncertainty.

Contel IPC estimates that on average it costs \$75 million to \$80 million to build a new trading room, including telephones, keyboards, screens, information sources, desks and backoffice support.

However, securities firms can ill afford to cut back on technological innovation, especially in their dealing rooms which in recent years have been a major profit center.

"The biggest challenge is that you are going into the unknown, and there is an element of risk there," points out Janet Wood at Data General, London. "[Firms] need a partnership between someone who knows the industry and someone who knows the technology.

"I don't think any of the vendors understand the financial industry so completely to offer the ultimate package, with everything," she adds. That, alone, is reason for wall Street firms or others in the securities business to develop proprietary applications on the core technology being offered by vendors.

E*TRADE Integrates Online Bond Center; Extends Leadership as One-Stop Financial Destination.

PR Newswire, p7148

June 11, 1999

TEXT:

E*TRADE Bond Center Enables Customers to Easily Access Powerful Analytical Tools, Research and Market Data and Directly Place Orders Online
PALO ALTO, Calif., June 11 /PRNewswire/ -- E*TRADE(R) Group Inc. (Nasdaq: EGRP) today announced the introduction of the E*TRADE Bond Center as a fully integrated feature of the Destination E*TRADE web site (www.etrade.com). Further strengthening E*TRADE's position as a one-stop financial services destination, the Bond Center empowers individual investors to make direct, informed investment decisions about a full spectrum of fixed income securities.

The Bond Center provides easy access to commentary, market data, research and analytical tools, including a sophisticated screening capability. This easy-to-use, proprietary tool allows investors to quickly search through a wide range of executable fixed income securities based on price, yield, maturity, issuer, credit rating and other criteria. Once an investor selects a bond, an order can quickly be entered with just a few keystrokes.

"E*TRADE is poised to do for bond investing what we've already done for stocks and mutual funds -- level the playing field for the individual investor," said Kathy Levinson, president and chief operating officer of E*TRADE. "Investing across the universe of government, corporate and municipals bonds can be confusing -- even for an expert trader. The Bond Center enables investors to identify and analyze bonds, make comparisons and place orders online across a wide range of fixed securities.

The E*TRADE Bond Center is another major step in creating the ultimate one-stop financial services destination for individual investors," continued Levinson. "From a single location on the Internet, investors now have immediate access to investing in stocks, options, mutual funds and bonds, as well as the tools, research and analysis they need to make informed investment decisions. Through our announced merger with Telebank Financial Corporation, our customers will have access to a full-featured FDIC-insured Internet cash management account, including online bill payment and ATM access."

Advanced in its ability to offer end-users real-time access to a full breadth of fixed-income securities, the E*TRADE Bond Center has operated since December 1998 as a standalone Beta site available to customers only upon request. All E*TRADE customers now can access the Bond Center via the Destination E*TRADE home page or trading tab.

Since the Bond Center's preliminary roll out in December, leading financial publications have been quick to recognize the system's diverse service offerings. Specifically, Marilyn Cohen, a columnist with Forbes, indicated in January, "This is the best deal for bond investors I have seen in my 22 years in the business." Also, Jim Frederick of Money Magazine in March wrote, "E*TRADE is the best place to trade bonds online."

The E*TRADE Bond Center is a real-time, fixed income securities trading service specifically designed to meet the needs of retail investors. The Bond Center includes:

- * Online investing of U.S. Treasuries (bills, bonds and strips), corporate bonds (investment and non-investment grade), municipal bonds, government agency bonds, zero coupon bonds and certificates of deposit.
- * Access to powerful analytical tools, including criteria-based search and

filtering capabilities for thousands of bonds that allow users to select bonds based on price, yield, maturity, coupon, credit rating and other criteria.

* A Bond Calculator for comparison of price and yields of fixed-income instruments.

* Automated bid and offer solicitations sent directly to professional trading desks.

* Daily Standard & Poor's and Moody credit ratings and descriptive data on

the entire spectrum of more than 1.5 million North American bonds.

* Professional commentary from fixed income analysts with

International

Data Corporation (IDC).

About E*TRADE

As the nation's most visited online investing web site, E*TRADE offers individual investors the convenience and control of automated stock, bond, options and mutual fund order placement at low commission rates. In addition, E*TRADE has a suite of value-added products and services that can be personalized, including portfolio tracking, real-time stock quotes, Smart Alerts, market commentary and analysis, news, investor community areas and other information services.

E*TRADE was the first securities and financial services company to be awarded the CPA WebTrust seal of assurance by the American Institute of Certified Public Accountants (AICPA). E*TRADE received the top ranking on the Internet Broker scorecard for Summer 1999 from leading independent industry analyst Gomez Advisors and, in the fourth quarter of 1998, was named the No. 1 online investing site in an international survey of the industry's top 20 Internet brokerage firms by Lafferty Information and Research Group, a global provider of high-value and business information research.

Investors can access E*TRADE at www.etrade.com on the Internet and through many other electronic channels and online services, including AOL (Keyword: E*TRADE) and via the TELE*MASTER interactive telephone system. E*TRADE Securities Inc. (Member NASD/SIPC), and its parent company, E*TRADE Group Inc., are headquartered in Palo Alto, Calif.

NOTE: E*TRADE is a registered trademark of the company. All other trademarks are properties of their respective owners. BT-FSIS introduces REMOS International Securities. (BT-Financial Services
Information Systems) (product announcement)
PR Newswire, 0609NY023
June 9, 1989

TEXT:

BT-FSIS INTRODUCES REMOS INTERNATIONAL SECURITIES
NEW YORK, June 9 /PRNewswire/ -- BT-Financial Services Information
Systems (BT-FSIS) has begun to market REMOS International Securities
(REMOS-IS). Developed by Bankers Trust, REMOS-IS is a real-time, global
trading and decision support system for international securities.

REMOS-IS supports multiple instruments, users, currencies and profit
centers. It currently supports Eurobond straights, floating rate notes,
mismatched FRNs, zero coupons, British gilts, and Canadian, Australian,
Japanese, German, Dutch, Belgian, and U.S. government securities. New
issues are entered on-line for immediate trading.

REMOS-IS includes The Securities Association reporting interfaces,
Association of International Bond Dealers bid and offer price reporting,
on-line mark-to-market revaluations, trading profit and loss, issuer limits
checking, Transaction Exchange System interface, FRN calculator and
automatic repricing against selected spreads and/or LIBOR.

REMOS-IS can maintain a price history database of an almost unlimited
number of securities. "The ability to perform real-time sophisticated
analytics on this database and display the results graphically is a
powerful tool to assist the trader in making decisions" said Bernard S.
Donefer, president of BT-FSIS.

REMOS-IS is a companion to REMOS Foreign Exchange (REMOS-FX) and
REMOS Money Market (REMOS-MM), software packages which automate the trading
of currencies and money market instruments. They are currently installed in
8 of the top 35 commercial banks in the world.

REMOS modules operate on the full range of Digital Equipment
Corporation VAX computers, and can be configured to support trading rooms
ranging from a group as small as five to an almost unlimited number of
traders.

BT-FSIS markets trading room software products to major financial
institutions worldwide, and also provides implementation assistance,
training, documentation, customization, maintenance, and 24-hour hotline
support.

BT-FSIS is a subsidiary of Bankers Trust New York Corporation (NYSE:
BT), the ninth largest banking firm in the U.S., based on assets of \$58
billion at year end 1988.

Telerate Adds GovPX U.S. Treasury Prices and Information.

Business Wire, p1276

Feb 8, 1999

TEXT:

NEW YORK--(BUSINESS WIRE)--Feb. 8, 1999--

Telerate(SM) becomes the only financial
information provider to offer clients real-time pricing
and data from all six inter-dealer brokers

Telerate, Inc., an affiliate of Bridge Information Systems, today
announced an agreement with GovPX, Inc. to carry the entire range of GovPX
United States treasury market quotes.

In providing GovPX prices alongside those already provided by Cantor
Fitzgerald, Telerate becomes the only financial information vendor to cover
all six inter-dealer brokers in the treasury securities market.

"With the addition of GovPX prices to its existing array of quotes
from other fixed income markets, and a suite of analytical tools, Telerate
becomes the ideal 'one-stop' solution for traders and investors in the
fixed income community," said John Jessop, president of Telerate, Inc. "No
other information source comes anywhere near matching Telerate's depth and
breadth of information on treasuries."

"We are very pleased to provide GovPX real-time benchmark Treasury
prices, volume and data to Telerate customers," said Lawrence Leuzzi,
chairman and CEO of GovPX, Inc. "The availability of GovPX products through
Telerate provides an exciting new distribution channel for GovPX, which
will benefit fixed-income professionals who rely on Telerate."

The new deal provides the Telerate workstations with GovPX offerings
and the Repo Index, which features repurchase agreement rates.

GovPX provides 24-hour, worldwide distribution of benchmark U.S.
Treasury information from the global trading activity of five of the six
inter-dealer brokers' transactions among the primary Treasury dealers
designated by the Federal Reserve. Real-time prices are available for
active and off-the-run Treasury Bills, Notes, Bonds, Basis, Money Markets,
Zero Coupons and Government Agency securities. GovPX provides the best bid
and best offer, size yields, last trade side (hit/take) and last trade
price for all active, WI and off-the-run issues. GovPX is the exclusive
source of trading volume by issue, maturity, sector and total.

The Repo Index offers timely and comprehensive overnight repurchase
agreement rates weighted by volume for on-the-run U.S. Treasuries and
General Collateral. Additionally, it compiles overnight repo volume for
trades transacted by participating brokers and dealers, plus intra-day repo
updates at 8:10, 8:30, 9:00 and 10:00a.m., including market commentary and
coverage of specials, off-the-run issues and term repos.

GovPX, Inc. was founded in 1990, by all the primary dealers and four
inter-dealer brokers serving the treasuries securities market. Its U.S.
Treasury service provides real-time prices and volume for Treasury Bills,
Notes, Bonds, Basis, Government Agency securities and Zero Coupons. Other
GovPX services include End of Day Pricing for Treasuries, SwapPX, The Repo
Index and The GovPX Historical Database. These fixed income financial
information products are available through a global network of market data
vendors, digital information feeds and the Internet.

Telerate, Inc., formerly Dow Jones Markets, was acquired by Bridge
Information Systems in May 1998 and is a wholly owned subsidiary of BRIDGE.
Over twenty-five years ago, Telerate pioneered electronic delivery of
financial information in the fixed income markets. Today, Telerate, a
leading provider of real-time financial information, is further enhanced by
the integration of BRIDGE data and news into Telerate products, and the
utilization of BRIDGE's IP network and server architecture.

BT-FSIS INTRODUCES REMOS INTERNATIONAL SECURITIES

NEW YORK, June 9 /PRNewswire/ -- BT-Financial Services Information Systems (BT-FSIS) has begun to market REMOS International Securities (REMOS-IS). Developed by Bankers Trust, REMOS-IS is a real-time, global trading and decision support system for international securities.

REMOS-IS supports multiple instruments, users, currencies and profit centers. It currently supports Eurobond straights, floating rate notes, mismatched FRNs, zero coupons, British gilts, and Canadian, Australian, Japanese, German, Dutch, Belgian, and U.S. government securities. New issues are entered on-line for immediate trading.

REMOS-IS includes The Securities Association reporting interfaces, Association of International Bond Dealers bid and offer price reporting, on-line mark-to-market revaluations, trading profit and loss, issuer limits checking, Transaction Exchange System interface, FRN calculator and automatic repricing against selected spreads and/or LIBOR.

REMOS-IS can maintain a price history database of an almost unlimited number of securities. "The ability to perform real-time sophisticated analytics on this database and display the results graphically is a powerful tool to assist the trader in making decisions" said Bernard S. Donefer, president of BT-FSIS.

REMOS-IS is a companion to REMOS Foreign Exchange (REMOS-FX) and REMOS Money Market (REMOS-MM), software packages which automate the trading of currencies and money market instruments. They are currently installed in 8 of the top 35 commercial banks in the world.

REMOS modules operate on the full range of Digital Equipment Corporation VAX computers, and can be configured to support trading rooms ranging from a group as small as five to an almost unlimited number of

traders.

BT-FSIS markets trading room software products to major financial institutions worldwide, and also provides implementation assistance, training, documentation, customization, maintenance, and 24-hour hotline support.

BT-FSIS is a subsidiary of Bankers Trust New York Corporation (NYSE: BT), the ninth largest banking firm in the U.S., based on assets of \$58 billion at year end 1988.

...TEXT: of all these bond offerings."

Bond Express provides an increase in trader productivity to bond trading desks that have a relatively low daily volume and don't specialize in a single type of instrument or require "real - time" access to price quotations. Quotes come in twice daily, early in the morning, but they remain fairly steady throughout the day.

The product can handle every type of bond simultaneously--municipals, corporate bonds, zero - coupon bonds, government bonds, mortgage backed securities and more.

And it eliminates the hundreds of cumbersome faxes a bank's trading department would otherwise receive--and sort through--each morning.
"We have 46 investment consultants who..."

... configured to structure a covered warrant product based on an underlyer that includes a foreign **exchange** certificate structured by the foreign exchange certificate management system.

The trade processing system includes a...may be measured over a first window of time and the change in the reference **price** may be measured over ...The method includes receiving a data feed that includes foreign exchange rate data, computing a **price** of a zero-coupon foreign exchange certificate based on the received foreign exchange rate data, computing a **price** of a foreign exchange covered warrant that includes an underlyer where the underlyer is (or includes) the **zero - coupon** foreign exchange certificate, and transmitting offer data to an investor. The offer data includes information descriptive of the foreign **exchange** covered warrant. The method may also include receiving a request for an offer of the foreign **exchange** covered warrant and transmitting the offer data in response to the request.

Implementations may include one or more of the following features. A value of the foreign **exchange** certificate at the time of issuance of the certificate can be calculated based on a data feed received from a computerized foreign **exchange** trading system. The data feed, and associated certificate **price** calculations may occur in **real - time**. The certificate **price** may also be computed based on factors such as a futiding rate, a charging rate...price, warrant type, and maturity date, and the issue may be managed by a computerized trading system. The method can also include monitoring a change in underlyer 1 0 price based on a previous closing price and halting investor trading when a rate of change of the underlyer price during a pricing window exceeds a...and monitoring system 109. The system 109 may be 1 0 configured to automatically halt trading of the covered warrant product when a price change ...ftuther configured to halt dissemination of price information from the system 104 or from the trade processing system 103 when a change in a reference price of the FX certificate exceeds...

...change in underlyer price based on a 1 5 previous closing price and halting investor trading when a rate of change of the underlyer price during a pricing window exceeds a permissible rate of change. A change from a reference certificate **price** may be ...same as the first window of time). One reason for doing this is to halt trading where the rate of price change fluctuations suggest that erroneous data is being received from an external information source (i.e., rate source 102).

The foreign **exchange** index upon which the FX Certificates are based can represent fluctuations in value between any...

...For example, Japanese Yen / United States Dollar valuations. Preferably, the index is derived from a **real - time** values of such currency **exchange** rates as provided from an existing **exchange**. In a preferred implementation, prices of FX certificates and FX covered warrants are disseminated through...

...As will be appreciated, the present methodology provides a mechanism whereby covered warrants on a **zero - coupon** certificate is issued in a way that permits investors to participate in a **price** changes that occur on a foreign **exchange** market while not requiring that the covered warrant rely directly on a foreign **exchange** rate as an underlyer. More

generally, the invention 'des the

... data to a central storage database for access by users.

While certain aspects of electronic trading have been automated,
conventional computerized trading systems do not address the concerns
expressed to the...

...real time price and quantity information pertaining to each financial
instrument from a market data feed ; and a system proprietor capable of
determining a national best bid and offer price and...

...by the system. Advantageously, the system provides
users with a mechanism to provide the best price at the time of
execution. In addition, the system of the invention utilizes historical
data to price securities that are spread off a benchmark where an
active quote for a particular security...

...information pertaining to customer and user position and offering
inventory, the offering inventory including a real time market
data feed ; executing trade orders based on a national best bid and

offer price or a derived price in the event the national best bid and offer price is not available; and applying a price improvement process to the national best bid and offer price or the derived price in the event that an offsetting trade occurs. In accordance with the method...
...of fixed income financial instruments,, and in particular U.S.

Treasury Securities, Liquid Agencies and Zero Coupon STRIPS.

Advantageously, the method described herein addresses stricter client demands, including the need to capitalize...

...invention; and
FIG. 3 is a process flow diagram illustrating system logic for processing a buy order in accordance with the present invention.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

The present invention...price and quantity available for execution for each financial instrument as provided by a real time market data feed from at least one interdealer broker or other proprietor of real time market data. The system proprietor converts the real time market data for each financial instrument in the offering inventory to a national best bid and offer price or a derived price for that a particular financial instrument in the event that the national best bid and offer price is not available and forwards this information to the system database for access by users...
...user can enter market and day limit orders for automatic execution of U.S. Treasury, Liquid Agency and Zero Coupon STRIP financial instruments.

Advantageously, the system proprietor applies a price improvement process to each trade...

...securities, quantity and price associated with each financial instrument in the offering inventory after a trade has been executed, modified or canceled. In addition, the system proprietor concomitantly updates customer position...

...each financial instrument in the offering inventory, (ii) applying a price improvement process to a trade in the event that an offsetting trade occurs, and (iii) updating the system database with securities, quantity and price associated with each financial instrument in the offering inventory after execution, cancellation or modification of a trade. Thus, system database 12 also provides means by which users can connect to the system...
...offering inventory.

Offering inventory database 14 provides a listing of all financial instruments available for trading by the system. Within the context of the present invention, financial instruments refer to all permutations of U.S.

Treasury, Liquid Agency and Zero Coupon STRIP instruments; for example, 30 year Treasury notes, as well as 3 month and 6 month treasury bills. More specifically, the offering inventory database 14 contains real time market data for each financial instrument offered for trading by the system. The market data consists of pricing information on each of the different treasury securities or securities that each of these interdealer brokers trade. The pricing information consists of four variables: (1) bid price ; (2) bid size

(the aggregate number of bidders and the amount that they want to buy at that price ; (3) offering price ; and (4) offering size (the aggregate total of security that would be offered at that...
...size) for securities that are not part of the offering inventory, i.e., available for trading by the system. The real time market data is provided by data feed 16 from...

March auto bundle scrap retakes some lost ground.
Marley, Michael
American Metal Market, v109, n42, p1
March 2, 2001
Language: English Record Type: Fulltext
Document Type: Magazine/Journal; Trade
Word Count: 577

... reflected slower auto production and the consequent fall in industrial scrap generation.

At the same time, several industry sources said the supplies of prime industrial steel scrap have tightened up in...

...fearing a further drop in prices, with the hopes of unloading scrap they had paid higher prices for before the market went any lower.

In addition to the bidding there was a...

...stamping plant.

Ford sold those bundles through a twostep, negotiated auction on ScrapSite, the first time the automaker had offered the bundles for sale on the Internet. Bidders were told to...

...by 2 p.m., and then the top five bidders were asked to submit a second offer.

The consequence was that the results were not, known by anyone in the trade until...

...several hours later than is typically the case. Some claimed that the lateness of the Internet bidding also apparently delayed the disclosure of the winning offers for the other auto bundles that were sold Wednesday. These included bundles from Ford's...

System for trading financial instruments updates offering inventory, national best bid and offer price or derived price of financial instrument in offering inventory

Alerting Abstract ...NOVELTY - System comprises an updatable system database, an updatable offering inventory database which receives real-time price and quantity information for each financial instrument from a market data feed provided by interdealer brokers, and a system proprietor determining the national best bid and offer price and a derived price. The proprietor applies a price improvement process to a trade if an offsetting trade occurs, and updates the system database and offering inventory to reflect transactions executed by the...
...ADVANTAGE - System provides consumers with the best price at the time of execution and retrieves prices for future analysis, and uses historical data to price securities...

...bids is disclosed. The method comprises checking (208) for whether a first bid exceeds a second bid in an auction for determining continuing priority for providing an ongoing service for at least...

...is dependent on whether the value of the first bid exceeds the value of the second bid, and wherein the relative priority for providing the service for the second bidder is dependent on whether the value of the second bid exceeds the value of the first bid. The method further comprises incrementing the first bid to a value exceeding the second bid if the first bid does not exceed the second bid (212), thereby causing the relative priority for providing service for the first bidder to exceed ...
